

# Rekonfigurowalność e-systemów

Testowanie wydajnościowe aplikacji webowej InnoPoint

## Aplikacja do testowania wydajnościowego

InnoPoint jest aplikacją do zarządzania projektami zespołowymi

## Narzędzia do testowania wydajnościowego

Laptop Lenovo ThinkPad T510
 System operacyjny Windows 7

Procesor:

Intel(R) Core(TM) i5 CPU

M 520 @ 2.40GHz 2.40 GHz

Zainstalowana pamięć

4,00 GB (dostępne: 3,80 GB)

(RAM):

Typ systemu:

64-bitowy system operacyjny

- Locust tworzy scenariusze obciążenia przy użyciu Pythona oraz obsługuje obciążenie rozproszone.
- 3. Psutil biblioteka do Python'a, pozwala na pomiary obciążenia procesora i pamięci dla wybranego procesu.

#### Scenariusze użycia

- Scenariusz standardowego użycia:
  - a. Użytkownik loguje się do aplikacji,
  - b. Tworzy grupę projektową,
  - c. Wybiera projekt,
- Scenariusz możliwości prowadzący:
  - a. Prowadzący loguje się do aplikacji,
  - b. Dodaje nowy projekt,
  - c. Powiadamia o tym użytkowników, pisząc post na tablicy (w aplikacji),
  - d. Przeprowadza weryfikację projektu.
- 3. Scenariusz testujący serwer losowymi zapytaniami w celu poprawnego obciążenia.

#### Scenariusz użycia - przykład

```
class AdminScenario (TaskSet):
   def on start (self):
       self.login()
   def login(self):
       response = self.client.put("/user", {"token": token})
       print("Resposne code:", response.status code)
       print("Response plain text: ", response.text)
   @task(1)
   def admin scenario(self):
       project id = self.add project()
       self.verify project (project id)
   def add project(self):
       project data = {"project": {
            "name": "Performance Testing",
            "short description": "Prepare performance tests for web application.",
            "long description": "Vulputate odio ut enim blandit volutpat maecenas",
            "number of members": 5,
           "technology": "Python, Locust",
            "tags": "WebDev, WebTest",
           "requirements": "none",
           "theme color": "#3f51b5",
           "verified": 1}, "token": token}
       response = self.client.post("/projects", json=project data)
        print("Resposne code:", response.status_code)
        print("Response plain text: ", response.text)
       response = json.loads(response.text)
        return response[0]['id']
   def verify project(self, project id=1):
       self.client.put("/projects/verify/{0}".format(project id), {"token": token})
```

#### Obszar badań

- Na podstawie scenariusz przeprowadzono badania,
- Badania dotyczyły pomiaru:
  - stabilności liczby żądań na sekundę,
  - czas odpowiedzi serwera na żądanie,
  - o zmiennej liczby użytkowników,
  - obciążenie procesora,
  - o obciążenie pamięci.

#### Problemy podczas testowania

- Uruchomienie i konfiguracja serwera,
- Stworzenie nowej bazy danych.

#### Wnioski

- Serwer Express jest wydajnym narzędziem do zastosowań backendowych,
- Kluczowym elementem testowania wydajności są:
  - zaplanowanie testów odpowiadającym realnym wymaganiom aplikacji,
  - poprawna konfiguracja podsystemów aplikacji,
- Locust jest łatwym w obsłudze i przyjaznym użytkownikowi narzędziem.
